

The Dry Skin Cycle - A New Model of Dry Skin And Mechanisms for Intervention (International Congress and Symposium)

Dry skin is a condition encountered extremely frequently in general practice, especially by dermatologists. Specific skin diseases like atopic dermatitis and ichthyosis, are characterized by dry skin, but skin dryness is also widely present in the general population who have overall healthy skin. For the individual, dry skin is experienced as unpleasant skin roughness, with itching and a sensation of tightness. This condition may degrade quality of life considerably. Dry skin is present predominantly in temperate and cold climates during the winter months, but it may also be precipitated by factors such as aggressive cleansing of the skin, psychological stress and ageing. Whilst in the past the pathophysiological events associated with dry skin have been well described, but not logically linked the cyclical model of dry skin sets out to explain the induction, propagation and perpetuation of the condition in an holistic way. Finally, this model provides the basis for teaching the patient and consumer how to deal with skin prone to dryness in a preventive way - providing patient empowerment in dermatology.
