

Medical Problems in Women over 70: When Normative Treatment Plans do not Apply

Care of the older patient is characterized by increasing incidence of chronic and acute diseases, with many patients suffering from several conditions simultaneously. The susceptibility to disease increases not only because of physiological factors relating to the aging process, but also due to changes in lifestyle, such as decreased mobility. Issues relating to polypharmacy are exacerbated by concerns about compliance, for example in patients experiencing cognitive decline. Decisions about appropriate medical care are complicated by the fact that many of the normal values that can be relied upon as a guide in younger individuals, do not apply in the older patient. These factors are particularly true for women, who tend to live longer and who undergo more dramatic physiologic changes, such as those associated with the menopause. This book is designed to educate gynecologists about these issues. It draws upon the experience of specialists in a variety of clinical and non-clinical specialties, reviews current knowledge of the problems encountered in caring for the elderly female patient, and suggests guidelines for best practice.
