

A Digest of metabolism experiments

This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1898 Excerpt: ...2 women, and a boy. The subjects of Nos. 1915-1918 were healthy individuals, the others were suffering from diabetes. The food was a simple mixed diet consisting of meat, bread, butter, eggs, etc., varying Boniewhat in the individual experiments. Most of the food was analyzed. For the nitrogen content of meat, however, Voits figure, 3.4 per cent, was used. The urine and feces were analyzed. The fuel value of the food and feces was determined or calculated. That of the urine was calculated from the amount of sugar it contained. The conclusion is reached that persons with diabetes do not, generally speaking, require more energy in the food than healthy individuals, and also that in the case of adults the disease does not increase metabolism. Nos. 1943-1954 were made by Mikhalevitch in St. Petersburg in 1880. The object was an investigation of the metabolism and assimilation of protein in scurvy patients. Two experiments are described, each lasting 16 days at the time of the disease and 15 days four and a half months later when the patients had completely recovered. Each experiment was divided into three periods; the first, with ordinary hospital diet; the second, with a milk and meat diet; and the third, with the hospital diet for scurvy patients. The nitrogen of the food, urine, and foces was determined by the Kjeldahl-Borodin method. The sulphates were also determined in the food and excreta by titrating with a uranium solution. The author sums up his results as follows: The assimilation of protein by scurvy patients was very satisfactory, and no less complete during the disease than after recovery. The assimilation of the milk and meat diet by the subjects both in health and with scurvy

was better than that of the ordinary hospital diet. The scurvy diet w...
