

Color Atlas of Hematological Cytology (A Wiley medical publication)

A comprehensive volume of 750 high-quality color photomicrographs of cells from blood, bone marrow, and lymph nodes. This updated, expanded edition shows the reaction patterns of all types of cells likely to be encountered under the microscope: both normal cells involved in blood formation and natural immunity and pathological alternatives, particularly cells in such diseases as anemia, leukemia, and lymphoma. It also illustrates a wide range of material and staining methods. Magnifications are high enough to show specific cytological details necessary for accurate diagnostic work.
